- 1. A simulated smoking device for non-burning use comprises:
- a vessel defining a hollow interior;
- a sheet located within said interior being adapted to carry an aromatic substance thereon;
- an oblong implement sized and shaped to penetrate into said interior and having a first abrasive end to scrape against said substance, thereby releasing said substance.
- The device of Claim 1, wherein said interior is divided
 by a septum into a first chamber and a second chamber;
- said septum being penetrated by a valved opening encouraging a unidirectional flow therethrough.
- The device of Claim 2, wherein said aromatic substance is located within said first chamber.
 - 1 4. The device of Claim 2, which further comprises a smokesimulating powder located in said second chamber.
 - The device of Claim 4, wherein said device further comprises a spline located within said second chamber.
 - 1 6. The device of Claim 2, wherein said unidirectional flow goes from said first chamber to said second chamber, thereby allowing exhalation.
 - 7. The device of Claim 4, wherein a portion of said smoke-

- simulating powder is selected from the group consisting of talc and diatomaceous earth.
- 1 8. The device of Claim 1, wherein said sheet is formed to 2 have a plurality of spaced apart thickened portions thereby 3 increasing the surface area of said sheet.
- 9. The device of Claim 8, wherein said plurality of thickened portions are formed by a helicoidal bead.
- 1 10. The device of Claim 2, wherein said implement is slidingly mounted to said device.
- 1 11. The device of Claim 2, wherein said implement is rotatively mounted to said device.
- 1 12. The device of Claim 1, wherein said abrasive end comprises a plurality of bristles.
- 1 13. The device of Claim 1, wherein said vessel comprises a distal terminus formed into an unevenly shaped mesh grid.
- 1 14. The device of Claim 2, wherein said device further
 2 comprises said vessel having a substantially cylindrical
 3 side wall; and
- said side wall being formed to have at least one valved port therethrough in communication with said first chamber.

- 1 15. The device of Claim 14, wherein said valved port opens
- when a pressure in said first chamber is reduced, thereby
- allowing inhalation.
- 1 16. A simulated cigarette comprises:
- a substantially cylindrically shaped oblong vessel
- formed to have an interior passageway; and
- valved means operating on said passageway for directing
- an inhalation flow past an aromatic substance, and an
- exhalation flow past a smoke simulating substance.
- 1 17. The simulated cigarette of Claim 16, wherein said
- aromatic substance is abrasively releasable.
- 1 18. The simulated cigarette of Claim 17, which further
- 2 comprises means for abrasively scraping said aromatic
- 3 substance.
- 1 19. The simulated cigarette of Claim 16, wherein said
- vessel further comprises a distal terminus formed into an
- unevenly shaped mesh grid.
